

Harvard Forest Data Archive HF069-17

Data File:

```
Name = hf069-17-harvest-annual.csv
Description = harvest plots annual summary
Rows = 10 Columns = 7
MD5 checksum = 42ea4d8e5072f9349456c19a79e6c330
```

Variables:

```
year = year
agwi = aboveground woody increment (megagramPerHectarePerYear)
agwb = aboveground woody biomass (megagramPerHectarePerYear)
recruit = biomass gained through recruitment
(megagramPerHectarePerYear)
mortality = biomass lost to mortality (megagramPerHectarePerYear)
anpp = net primary production. calculated as the sum of the
increment of surviving trees (AGWI) + the sum of the increment of ingrowth +
the sum of fine litterfall using the methods described in Clark et
al. 2001. (megagramPerHectarePerYear)
```

Variable	Min	Median	Mean	Max	NAs
year	1999.000	2003.500	2004.400	2017.000	0
agwi	0.750	1.685	1.562	2.180	0
agwb	66.730	75.100	77.729	92.320	0
recruit	0.000	0.060	0.065	0.130	0
mortality	0.000	0.310	0.560	2.540	0
anpp					10
